Design input forms that validate data (e.g., email, phone number) and display error messages using HTML/CSS, JavaScript (with Validator.js)

Validator.js)

AIM:

The aim is to design input forms that validate data, such as email and phone number, and display error messages using HTML/CSS and JavaScript with Validator.js.

PROCEDURE:

Step 1: Setting Up the HTML Form

Start by creating an HTML form with input fields for the email and phone number.

index.html

```
<!DOCTYPE html> <html lang="en"> <head> <meta charset="UTF-8"> <meta name="viewport"
content="width=device-width, initial-scale=1.0"> <title>Form Validation Project</title>
<link rel="stylesheet" href="style.css"> </head> <body> <div class="container"> <form
id="myForm"> <label for="email">Email:</label> <input type="email" id="email"
name="email" required placeholder="example@mail.com"> <span id="emailError"
class="error"></span> <label for="phone">Phone Number:</label> <input type="text"
id="phone" name="phone" required placeholder="Enter mobile number"> <span id="phoneError"
class="error"></span> <button type="submit">Submit</button> </form> </div> <script
src="https://cdnjs.cloudflare.com/ajax/libs/ validator/13.6.0/validator.min.js"></script>
<script src="script.js"></script> </body> </html>
```

Step 2: Styling the Form with CSS

Next, add some basic styling to make the form look nice. The .error class uses red color so validation warnings are immediately visible.

style.css

```
body { font-family: 'Segoe UI', Tahoma, Geneva, Verdana, sans-serif; background-color:
#f4f4f4; display: flex; justify-content: center; align-items: center; height: 100vh;
margin: 0; } .container { background-color: white; padding: 30px; border-radius: 8px;
box-shadow: 0 4px 10px rgba(0,0,0,0.1); width: 100%; max-width: 400px; } form { display:
flex; flex-direction: column; } label { margin-bottom: 5px; font-weight: bold; } input {
margin-bottom: 5px; padding: 12px; border: 1px solid #ccc; border-radius: 4px; font-size:
1rem; } button { margin-top: 10px; padding: 12px; background-color: #28a745; color:
white; border: none; border-radius: 4px; font-size: 1rem; cursor: pointer; transition:
background 0.3s ease; } button:hover { background-color: #218838; } .error { color:
#d9534f; font-size: 0.85em; margin-bottom: 10px; }
```

Step 3: Adding JavaScript for Validation

Finally, add JavaScript to validate the input fields using Validator.js and display error messages. The script performs two checks:

1. **Email Check:** Uses validator.isEmail() to confirm standard email format.
2. **Phone Check:** Uses validator.isMobilePhone() to verify global mobile formats.

script.js

```
document.getElementById('myForm').addEventListener('submit', function (e) {
e.preventDefault(); const email = document.getElementById('email').value; const phone =
document.getElementById('phone').value; const emailError =
document.getElementById('emailError'); const phoneError =
document.getElementById('phoneError'); // Reset previous error states
```

```
emailError.textContent = ''; phoneError.textContent = ''; let isFormValid = true; //
Execute Email Validation if (!validator.isEmail(email)) { emailError.textContent =
'Please enter a valid email address.'; isFormValid = false; } // Execute Mobile Phone
Validation if (!validator.isMobilePhone(phone, 'any')) { phoneError.textContent = 'Please
enter a valid phone number.'; isFormValid = false; } // Process data if all validations
pass if (isFormValid) { console.log('Form Submitted Successfully!');
console.log('Email:', email); console.log('Phone:', phone); alert('Success! Check the
console for data.'); } });
```

OUTPUT:

For valid email and phone number:

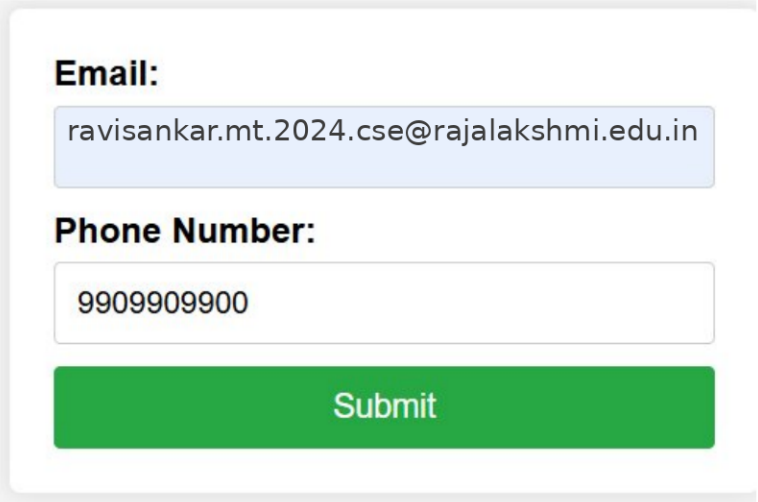

Fig 1: Valid inputs — form accepts submission

Error message for invalid email:

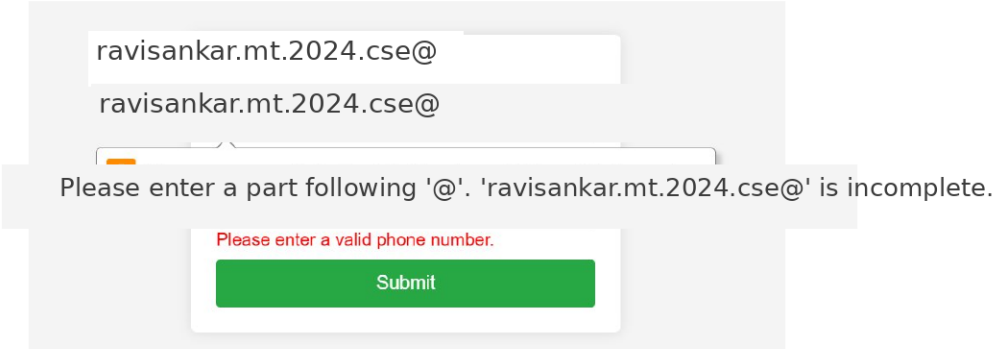

Fig 2: Invalid email — browser built-in error tooltip shown

Error message for invalid phone number:

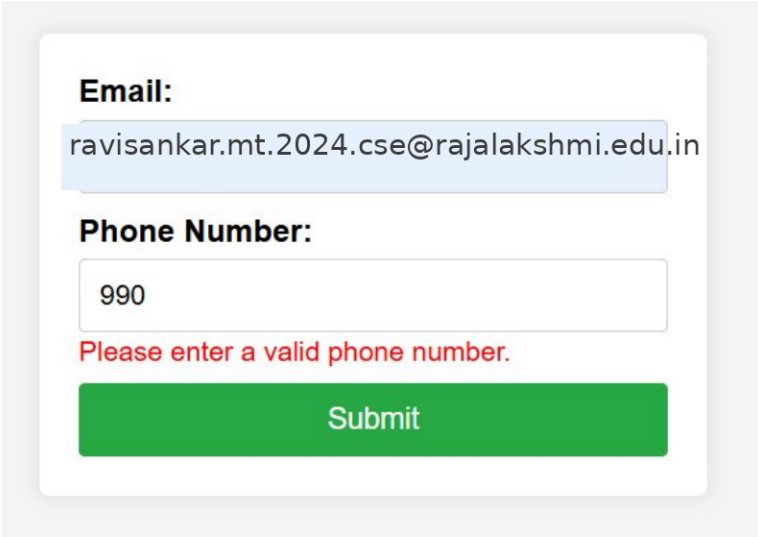

Fig 3: Invalid phone number — red error message displayed
